Activity 1 Sort the product catalog:

Before:

After:

Main Code Changes:

1. Added sorting state

const [sortBy, setSortBy] = useState('default');

This stores the sorting option selected by the user.

2. Added sorting logic

const sortedProducts = [...filteredProducts];

This creates a copy of the filtered products so the original array is not modified.

3. Added sorting conditions

```
if (sortBy === 'price-low') {
  sortedProducts.sort((a, b) => Number(a.price) - Number(b.price));
} else if (sortBy === 'price-high') {
  sortedProducts.sort((a, b) => Number(b.price) - Number(a.price));
} else if (sortBy === 'name-az') {
  sortedProducts.sort((a, b) => a.name.localeCompare(b.name));
}
```

These conditions arrange products from cheapest to most expensive, most expensive to cheapest, or alphabetically.

4. Added a Sort dropdown

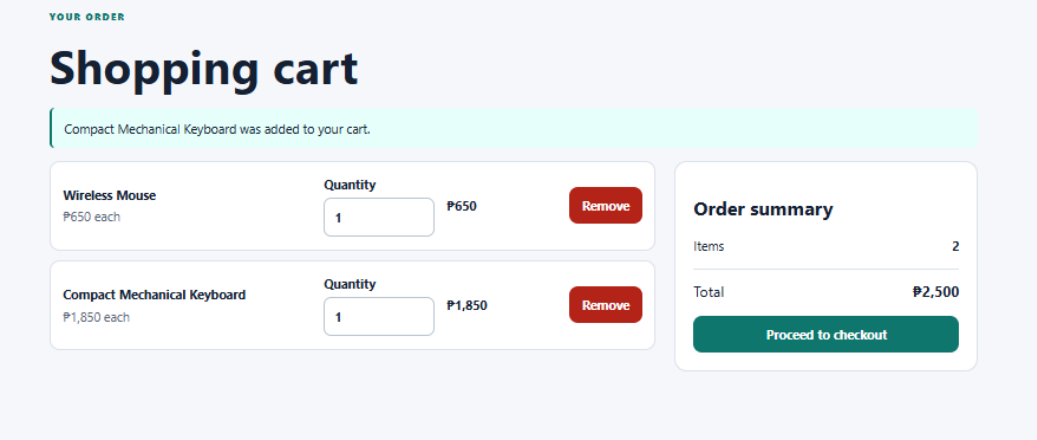

The new dropdown allows users to choose how products should appear without affecting the existing search and category filters.

Conclusion:

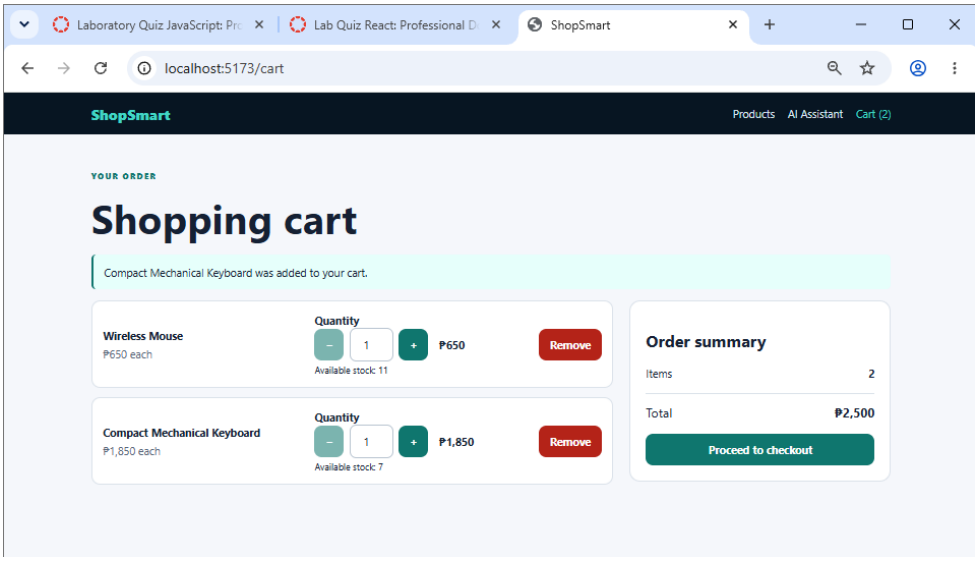

The main improvement is that we added product sorting while keeping the existing search and category filtering features. This makes ShopSmart easier to use and helps customers compare products more conveniently.

Activity 2 Make cart quantities easier to change:

Before:

After:

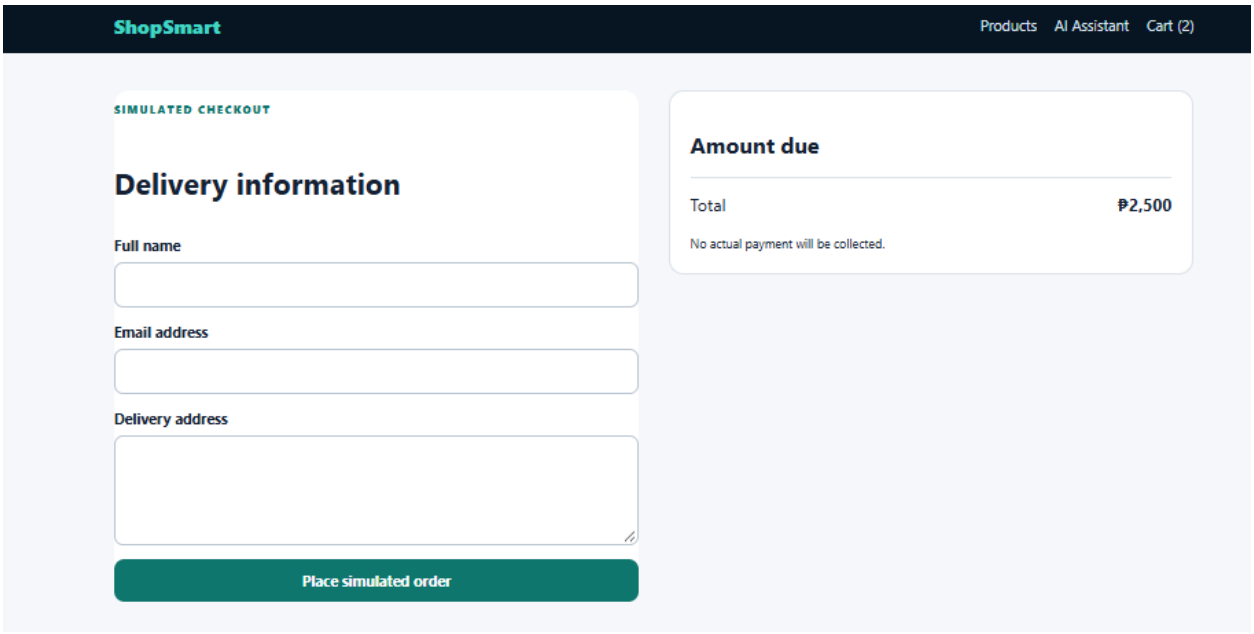

The screenshot shows that we successfully added plus (+) and minus (−) buttons to adjust product quantities in the shopping cart. The Wireless Mouse has a quantity of 2, while the Compact Mechanical Keyboard has reached its stock limit of 7. The system correctly updates the item subtotals, total quantity of 9, and order total of ₱14,250. The plus button is also disabled when the product reaches its available stock.

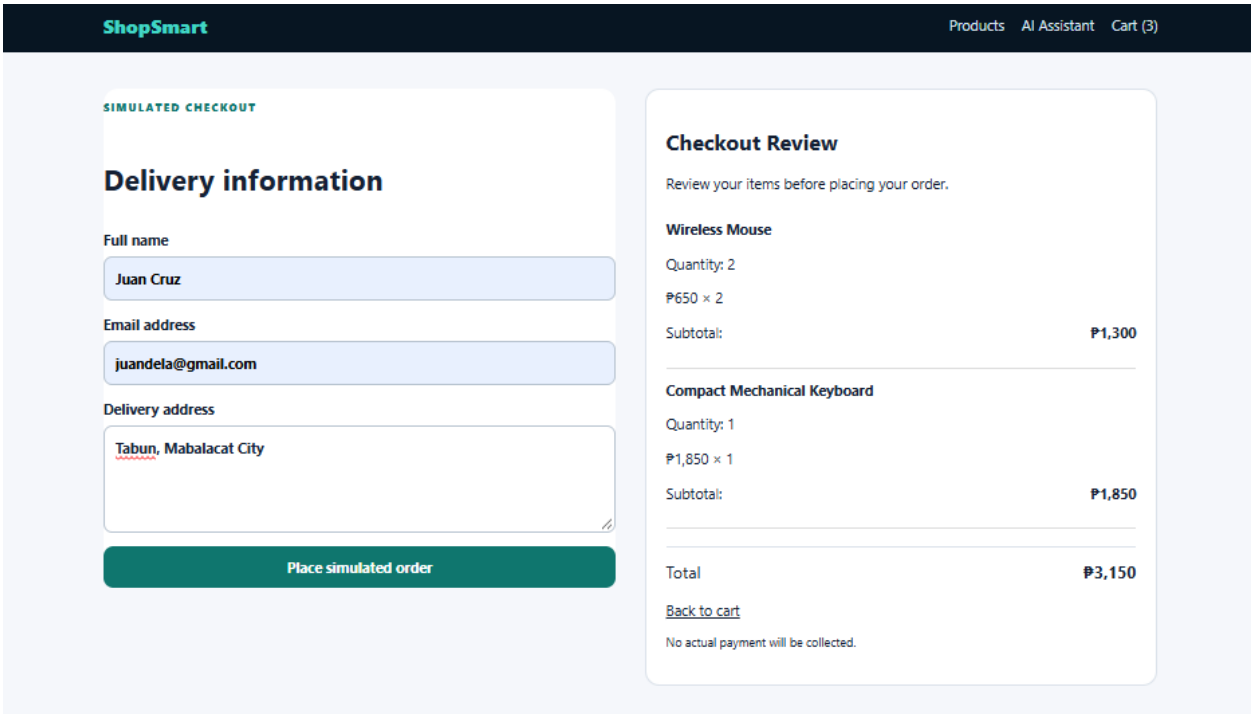

Conclusion: We improved the shopping cart by making quantity adjustments easier for users. The displayed totals update correctly, and the stock limit prevents users from adding more items than are available.

Activity 3 Show an itemized checkout review:

Before:

After:

The screenshot shows that we successfully added an itemized checkout review to our ShopSmart application. It displays the USB-C Study Lamp and USB Headset with their quantities and individual subtotals. We used the existing cart data to display each product and calculate the total amount of ₱ 3,150. We also kept the delivery information form and added a Back to Cart option.

Conclusion: We improved the checkout page by allowing customers to review their products, quantities, and total amount before placing an order. This makes the checkout process clearer and helps prevent ordering mistakes.

Activity 1-3 Conclusion:

In Activity 1, we added a sorting feature and stored the selected option using React's useState. We used filter() and sort() together so users can search, filter by category, and arrange products by price or name. We also copied the filtered products before sorting to keep the original product order unchanged. In Activity 2, we added plus and minus buttons to make adjusting cart quantities easier. We reused the existing setQuantity() function to follow the same quantity and stock rules. In Activity 3, we used the shared cart data and map() to display product names, quantities, and subtotals in the checkout review. These improvements make ShopSmart easier to use while keeping the cart and checkout information consistent.

npm run check’s screenshot:
